

Data Augmentation

Data SAIL Club – Spring 2026

What is it?

Technique used to artificially increase the size and diversity of a training dataset by creating modified versions of existing data.

Enables models to learn invariant features, such as recognizing a cat regardless of its orientation or lighting, by exposing them to varied but realistic input variations.

Widely used in computer vision, natural language processing and audio processing.

Augmented data is derived from real data through transformations (while synthetic data is generated from scratch)

Mostly.ai

<https://mostly.ai/>

- Augment your data from the previous meeting and try to improve your model's performance.

Generators

Generators are models that learn from original data. Once trained, they allow to create any number of synthetic samples as well as simulated scenarios to your needs.

Train a generator

On platform

Train a generator with your data on platform.

Start from a connector

Upload your data

Locally

Train a generator on your environment and import it to use it in the platform.

Use the SDK

Import a generator

Available generators
